DETAILED ACTION

**ERROR DETECTION AND SUPPRESSION IN A TDMA-BASED NETWORK
NODE**

RESPONSE TO ARGUMENTS/REMARKS

Claims 1 – 20 are pending in the application.

Examiner's Amendment

1. An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it MUST be submitted no later than the payment of the issue fee.
2. Authorization for this examiner's amendment was given by correspondence with Shane Sondrel (Attorney No. 60,145) on June 1, 2011.
3. Please amend the claims in this application as follows;

1. (Currently Amended) A network node comprising:
 - a communication unit for the implementation of a communication protocol for communication with other network nodes via a communication medium,
 - a bus monitor, and
 - a bus driver, wherethe communication unit and the bus monitor each mutually independently implement an access time schedule contained in a configuration data record, and each make available, in accordance with the access time schedule, a release signal for the bus driver,
 - the bus driver evaluates these two release signals and, in the event that the two release signals do not coincide in time, blocks the access of the network node to the

Art Unit: 2462

communication medium.

11. (Currently Amended) A network node for communication with other network nodes via a communication medium, the network node comprising:

a bus driver configured to evaluate two release signals for equality of the release information made available to it;

two separate units provided in the network node, which, mutually independently, each implement an access time schedule to generate the release signal; and

wherein, in the event that the release signals do not coincide in time, the bus driver is configured to block the access of the network node to the communication medium.

12. (Currently Amended) A network device for communicating with other network devices over a communications medium, the device comprising:

a bus monitor to independently generate a release signal in response to a time schedule from a configuration data record, the time schedule specifying times at which each network device can exclusively communicate on the communications medium;

a communication circuit to independently generate another release signal in response to the time schedule, and to implement a communication protocol for communication with the other network nodes via the communication medium;

a bus driver to evaluate the independently-generated release signals and to block access to the communications medium in response to the evaluation indicating that the release signals do not coincide in time.

13. (Currently Amended) The device of claim 12, wherein

the network device communicates with said other network devices over a single communications medium, and

the bus driver evaluates the independently-generated release signals to ensure that both signals match one another to ~~mitigate~~ block a network access condition resulting from an improperly-generated release signal.
